Q1. DICTIONARY**ANSWER**

```
d={'a':1,'b':4,'c':3}
result=dict(sorted(d.items(),key=lambda item:item[1]))
print(result)

#op: {'a':1,'c':3,'b':4}
```

Q2. LIST**ANSWER**

```
def enqueue(val):
    l.append(val)
def dequeue():
    l.pop(0)
def front():
    return l[0]
def is_empty:
    if len(l)==0:
        return True
    else:
        return False
l=[(int i) for i in input().split(" ")]
enqueue(10)
dequeue()
print(l,front(),is_empty())

#ip: 1 2 3 4 5
#op:[2,3,4,5,10] 2 False
```

Q3. SET**ANSWER**

->how data is stored:
 -->list are stored as dynamic arrays whereas sets are stored as hash tables
 -->lookup performance
 -->time complexity set:O(1) whereas for lists:O(1) to O(n)
 -->access method:
 -->sets uses a hash function to jump to the value directly whereas list scan elements sequentially
 -->insertion and deletion:
 -->sets avoid memory shifting operation whereas list require memory shifting operation

Q4. Tuple**ANSWER**

```
a=(1,2,3,4,5)
b=list(a)#here a is converted into a list then stored into b using list() function
c=tuple(b)#here b is converted into a tuple then stored into c using tuple() function
print(b,c)
#op:[1,2,3,4,5] (1,2,3,4,5)
```

->a list to tuple conversion is required when the elements should not/doesn't need to be modified
 -->whereas a tuple to list conversion is needed/used when the elements of a tuple need to be modified/removed

Q5. SET**ANSWER**

```
s1={1,2,3,4,5,6,7,8,9}
s2={6,7,8,9,10,11,12,13,14}
print("union of sets:",s1|s2)
print("intersection of sets:",s1&s2)
print("difference of sets:"s1-s2)
#op: {1,2,3,4,5,6,9,8,7,10,11,12,13,14}
      {6,8,7,9}
      {5,2,3,4,1}
#all the output will be in random order rather than the exact order it was given!!
```
